

AI ASSISTANT CODING

ASSIGNMENT-24

Name: P.Sanjana

Hallticket:2303A51435

Batch:21

Task 1 – Environment Setup

- Create a free Replit account.
- Explore the mobile app development templates (React Native / Flutter / HTML5 hybrid).
- Install required packages or dependencies in the Replit environment.

Prompt:-

development templates like React Native, Flutter, and HTML5. After selecting a suitable template, I set up the workspace and installed the required packages. This step helped me understand how the development environment works. It also ensured that everything was ready before starting the actual app development.

Output:-

Workspace Guide

Introduction

Explore Templates

Workspace Setup

Install Packages

Ready to Build

1 Choosing Your Canvas

You don't need to build from scratch. Templates provide a solid foundation with best practices baked in. The first step is deciding which foundation fits your project's goals.

React Native

Build true native apps for iOS and Android using React and JavaScript.

- ✓ One codebase, two platforms
- ✓ Huge community ecosystem
- ✓ Native performance

Flutter

Google's UI toolkit for building beautiful, native compiled applications.

- ✓ Expressive, flexible UI
- ✓ Fast development (Hot Reload)
- ✓ Uses Dart language

HTML5 / Web

The universal standard. Build responsive web apps accessible everywhere.

- ✓ Runs in any browser
- ✓ Zero installation required
- ✓ Easiest learning curve

2 Preparing the Workspace

Once you've selected a template, the workspace spins up. This is where your code lives, runs, and is tested. Think of it as unboxing a fresh set of tools on a clean workbench.

~/projects/workspace-setup

→ Fetching template repository...

Cloning into 'workspace-setup'...

→ Setting up environment variables...

Created .env from .env.example

→ Initializing git repository...

✓ Workspace ready.

Configuration Files

Hidden files like `.gitignore` and `tsconfig.json` are created. They tell the system how to handle your code silently in the background.

Integrated Terminal

Your command center. This is where you talk directly to the machine, run servers, and execute scripts.

3 Installing Dependencies

Modern apps rely on libraries built by others—things like UI components, routing, and animations. Before you run the app, you need to download these building blocks.

package.json

The Recipe

A list of every library your project needs. It tells the package manager exactly what to download.

→

node_modules /

The Pantry

The folder where all those downloaded libraries are stored. It's often huge, but you rarely need to look inside.

Explore Templates

Workspace Setup

Install Packages

Ready to Build

You're Ready to Build.

The template is loaded, the workspace is clean, and the dependencies are installed. The invisible work is done.

Next Steps

1 Start the development server

Run your app locally to see changes in real-time as you code.

2 Open your main entry file

Usually `App.jsx` or `index.html`. Make a small change and watch it update.

3 Build something amazing

The environment is yours. Start writing logic, styling components, and bringing your idea to life.

Task 2 – Basic Mobile App

- Build a simple "Hello App" that displays:

- o App Title

- o User's Name (input field + button)

- o Greeting message dynamically updated.

- Use AI assistance to generate boilerplate code and explain structure.

Prompt:-

developed a simple "Hello App" that displays the app title along with an input field for the user's name. A button was added to generate a greeting message dynamically based on the input. This task helped me understand how user input works and how data can be displayed in real time. The structure of the app was kept simple for better clarity.

Output:-

Task 3 – Adding Features with AI Assistance

- Enhance the app with:
 - o Navigation bar (Home, About, Contact).
 - o Form handling (e.g., user registration page).
 - o Basic styling with CSS or React Native styles.
- Ask AI in Replit to add inline documentation for each function.

Prompt:-

enhanced the app by adding a navigation bar with pages like Home, About, and Contact. I also created a basic user registration form with simple validation. To improve the appearance, I applied basic styling to the app. Additionally, I included inline comments in the code to make it easier to understand each function.

Task 4 – Testing on Mobile

- Run the app in Replit's mobile preview mode.
- Test responsiveness on different screen sizes.
- Fix UI alignment issues with AI suggestions.

Prompt:-

building the features, I tested the app using Replit's mobile preview mode. I checked how the app looked on different screen sizes and made sure all elements were properly aligned. Some minor UI issues were identified and fixed with the help of AI suggestions. This step ensured that the app runs smoothly on mobile devices.

Task 5 – Deployment

- Deploy the app using Replit hosting or export it to a mobile framework (like Expo for React Native).
- Share the deployment link with peers for testing.

Expected Outcomes:

- Students will understand how to use Replit for mobile app development.
- Ability to build a basic functional mobile app with UI, navigation, and user interaction.
- Experience in AI-assisted coding, debugging, and documentation for mobile applications.

Prompt:-

deployed the application using Replit hosting and generated a shareable link. After deployment, I tested the app again to confirm that all features were working correctly. I then shared the link with others to gather feedback. This step gave me a complete understanding of how to make an app accessible online.
